

How does RCF-160N work?

Harmful moisture or gas will not pass through an individual glass flake
Millions of glass flakes collectively form a highly tortuous pathway

The glassflakes orientate as the film forms. The rigidity of the glassflakes combine with the strength of specially formulated resins creating impermeable protection barriers against abrasion and corrosion however hostile the environment.

The glassflakes add tremendous strength to the coatings. The enhanced elongation and compression qualities provide superior resistance to the most severe abrasion and impact environments.
